MOVING TARGETS

# TASKS OF WIRELESS SENSOR NETWORKS (WSN)

- monitor physical and environmental conditions
- perform surveillance tasks (target detection, localization, and tracking)

## WSN CHARACTERISTICS

### Sensors

- deployed over a region according to a regular pattern (e.g. grid), at random, or in an ad hoc manner
- **collect information** about the surrounding environment
- have fairly limited **data processing** capabilities
- **communicate** with other sensors and a remotely located (**fusion**) center

**Fusion center** processes data from sensors and makes a global (and more precise) situational assessment.

# TARGET LOCALIZATION: PROBLEM FORMULATION

- N sensors deployed over the monitored region
- A target at location  $v$  emits a signal of strength  $S_0$
- Sensor  $i$  located at position  $s_i$  obtains **energy** readings

$$E_i = S_i + \epsilon_i = S_0 C_\eta(\delta_i(v)) + \epsilon_i,$$

where  $\delta_i(v) = \|v - s_i\|$ ,  $C_\eta(\cdot)$  is a monotone signal decay function,  $C_\eta(0) = 1$ .

- Assume **random noise**  $\epsilon_i$  are i.i.d.
- Each sensor makes a **decision**  $Y_i = \mathbf{1}(E_i \geq \tau)$
- $\tau$  is a function of an individual sensor false alarm probability  $\gamma$

- **Overview:** surveillance monitoring (Estrin, 2006);
- **Information Fusion and Target Detection:** (Clouqueur, 2001, Katenka et al., 2006).
- **Localization:** radar systems (Abdel-Samad and Tewfik, 1999); energy based methods (Kaplan, 2001; Li, 2002; Sheng, 2003; Blatt and Hero, 2006); binary decisions based methods (Niu and Varshney, 2004; Noel, 2006; Ermis and Saligrama, 2006).

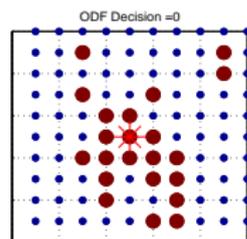

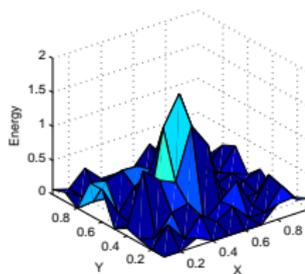

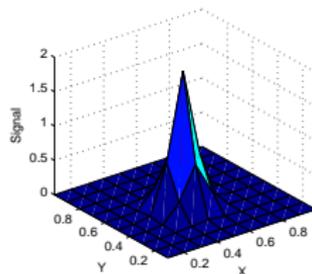

# SIGNAL DECAY MODELS CONSIDERED

$$\text{M1: } S_i = S_0 \exp(-\delta_i(v)/\eta)^2),$$

$$\text{M2: } S_i = \frac{S_0}{1 + (\delta_i(v)/\eta)^3}.$$

where  $\eta$  is a tuning parameter

- **M1** is appropriate for capturing **temperature attenuation** patterns (example below)
- **M2** is widely used for **acoustic signals**

INTRODUCTION

TARGET  
LOCALIZATION  
AND TRACKING

PERFORMANCE  
EVALUATION

MOVING TARGETS

## ORDINARY DECISION FUSION (ODF)

- Only positive decisions  $Y_i$  are transmitted to fusion center  $\Rightarrow$  low **communication cost**
- More robust to noise than energy-based methods (**value fusion**)

## LOCAL VOTE DECISION FUSION (LVDF)

- 1 Sensor  $i$  makes an **initial decision**  $Y_i$  and communicates it to all sensors in its neighborhood  $U(i)$
- 2 Given the set of decisions  $\{Y_j : j \in U(i)\}$ , sensor  $i$  **adjusts** its initial decision according to a **majority vote**:

$$Z_i = \mathbf{1} \left( \sum_{j \in U(i)} Y_j > M_i/2 \right),$$

where  $M_i = |U(i)|$  is the size of the neighborhood

TARGET  
LOCALIZATION  
AND TRACKING

PERFORMANCE  
EVALUATION

MOVING TARGETS

Given the energy measurements  $E_i$ , or binary initial  $Y_i$ , or corrected  $Z_i$  decisions,

- 1 detect the presence of a target
- 2 identify target location  $v = (v_x, v_y)$
- 3 estimate the strength of the signal  $S_0$
- 4 with information available over time, track target trajectory through the monitoring region

Remark: In the remainder, it is assumed that all communication tasks have been resolved.

INTRODUCTION

TARGET  
LOCALIZATION  
AND TRACKING

PERFORMANCE  
EVALUATION

MOVING TARGETS

- 1 ML(E) Maximum likelihood estimation based on energy readings  $E_i$  (gold standard)
- 2 ML(Y) Maximum likelihood estimation based on original decisions  $Y_i$
- 3 ML(Z) Maximum likelihood based on corrected decisions  $Z_i$
- 4 Hybrid methods that combine energy readings  $E_i$  from sensors that returned a positive decision and imputed energy readings from the remaining sensors

Let  $\theta = (v_x, v_y, S_0, \sigma^2, \eta)$  vector of unknown parameters.  
Assuming Gaussian i.i.d. noise with 0 mean and variance  $\sigma^2$ ,  $E_i \sim N(S_0 C_\eta(\delta(v)), \sigma^2)$ ,  $\{Y_i\} \sim \text{Bernoulli}(\alpha_i)$

$$\alpha_i(\theta) = 1 - \Phi(A_i(\theta)),$$

where  $A_i(\theta) = \frac{\tau - S_0 C_\eta(\delta_i(v))}{\sigma}$ .

- Direct numerical maximization of the log-likelihood function of  $\{Y_i\}$ :

$$\ell_Y(\theta) = \sum_{i=1}^N [Y_i \log \alpha_i(\theta) + (1 - Y_i) \log(1 - \alpha_i(\theta))].$$

- Expectation-Maximization (EM) algorithm.

INTRODUCTION

TARGET  
LOCALIZATION  
AND TRACKINGPERFORMANCE  
EVALUATION

MOVING TARGETS

## EXPECTATION-MAXIMIZATION (EM) ALGORITHM

**M-step:**

$$\hat{S}_0 = \frac{\sum_{i=1}^N E_i C_\eta(\delta_i(v))}{\sum_{i=1}^N C_\eta^2(\delta_i(v))},$$

$$\hat{\sigma}^2 = \frac{1}{N} \sum_{i=1}^N (E_i - \hat{S}_0 C_\eta(\delta_i(v)))^2$$

**E-step:**

$$\hat{E}_i = \mathbb{E}[E_i | Y] = \mathbb{E}[E_i | Y_i]$$

$$\begin{aligned} \mathbb{E}[E_i | Y_i = 0] &= \frac{\int_{-\infty}^{\tau} x p_{E_i}(x) dx}{\int_{-\infty}^{\tau} p_{E_i}(x) dx} = \\ &= S_0 C_\eta(\delta_i(v)) - \frac{\sigma \exp\left(-\frac{A_i(\theta)^2}{2}\right)}{\sqrt{2\pi} \Phi\left(-\frac{A_i(\theta)^2}{2}\right)} \end{aligned}$$

INTRODUCTION

TARGET  
LOCALIZATION  
AND TRACKING

PERFORMANCE  
EVALUATION

MOVING TARGETS

- Direct log-likelihood is complicated ( $Z_i$  correlated)
- Use **pseudo-likelihood** (assuming  $Z_i$  independent)
- Assume for neighbors  $j \in U(i)$ ,  
 $\mathbb{P}(Y_j = 1) \approx \mathbb{P}(Y_i = 1)$

Let  $\beta_i(\theta) = \mathbb{P}(Z_i = 1)$ ,

$$\mathbb{P}(Z_i = 1) = \mathbb{P}\left(\sum_{j \in U(i)} Y_j \geq \frac{M}{2}\right) \approx \sum_{k=[M/2]}^M \binom{M}{k} \alpha_i^k (1 - \alpha_i)^{M-k}$$

The **pseudo-loglikelihood** function for the adjusted decisions  $Z_i$  is given by:

$$\ell_Z(\theta) = \sum_{i=1}^N [Z_i \log \beta_i(\theta) + (1 - Z_i) \log(1 - \beta_i(\theta))].$$

## Expectation-Maximization Algorithm

- **M-step** is the same as for ODF
- **E-step** requires calculating  $\mathbb{E}[E_i|Z]$ :

$$\begin{aligned}\mathbb{P}[E_i|Z] &= \frac{1}{\mathbb{P}(Z)} \sum_{k=0,1} \mathbb{P}(E_i, Z | Y_i = k) \mathbb{P}(Y_i = k) = \\ &= \frac{1}{\mathbb{P}(Z)} \sum_{k=0,1} \mathbb{P}(E_i | Y_i = k) \mathbb{P}(Z | Y_i = k) \mathbb{P}(Y_i = k)\end{aligned}$$

$$\mathbb{E}[E_i|Z] = \sum_{k=0,1} \mathbb{E}(E_i | Y_i = k) \mathbb{P}(Y_i = k|Z)$$

INTRODUCTION

MOVING TARGETS

## Expectation-Maximization Algorithm

$$\mathbb{E}[E_j|Z] = \sum_{k=0,1} \mathbb{E}(E_j|Y_i = k)\mathbb{P}(Y_i = k|Z)$$

- $\mathbb{E}[E_j|Y_i]$  obtained in the E-step for ODF
- $\mathbb{P}(Y_i = k|Z)$  to be calculated as:

$$\begin{aligned}\mathbb{P}(Y_i = 1|Z) &= \frac{\mathbb{P}(Y_i = 1)\mathbb{P}(Z|Y_i = 1)}{\mathbb{P}(Z)} \\ &= \alpha_j \prod_{j:i \in U(j)} \frac{\mathbb{P}(Z_j|Y_i = 1)}{\mathbb{P}(Z_j)}\end{aligned}$$

INTRODUCTION

TARGET  
LOCALIZATION  
AND TRACKINGPERFORMANCE  
EVALUATION

MOVING TARGETS

Using the energy readings from  $Y_i = 1$  or  $Z_i = 1$

- Reduces communication cost relative to ML(E)
- Improves localization relative to ML(Y) or ML(Z)

Impute remaining energy readings by:

- **Hybrid Expectation Maximization (HEM):** model  $\hat{E}_i = \mathbb{E}[E_i | Y_i = 0]$  for ODF and  $\hat{E}_i = \mathbb{E}[E_i | Z_i = 1]$ ,  $i \in \{Z_i = 0\}$
- **Hybrid Maximum Likelihood (HML):** set  $\hat{E}_i = \tau$  for  $i \in \{Y_i = 0\}$  ( $i \in \{Z_i = 0\}$ )

## SIMULATION STUDY SETUP

- Focus on the target location  $\nu$  and the signal amplitude  $S_0$  estimation
- Assume the parameters  $\eta$  and  $\sigma^2$  are known
- Gaussian noise with mean zero, variance  $\sigma^2$
- WSN deployed on a  $20 \times 20$  grid in the unit square, true target location  $\nu = (1/4, 1/4)$ ,  $S_0 = 2$ , the individual sensor's false alarm  $\gamma = 0.1$ , and the network's false alarm  $F = 0.1$ .
- signal-to-noise ratio  $\text{SNR} = S_0/\sigma$
- *all* the algorithms detected the target according to their respective detection algorithm

# TRUE NOISE DISTRIBUTION $t_3$ MISSPECIFIED AS GAUSSIAN, WITH SNR=5

(a)

(b)

- **(a)** the difference between average distances from true  $v$  for misspecified and true models
- **(b)** the difference between RMSE of  $\hat{\Sigma}_0$  for misspecified and true models

# SUMMARY OF SIMULATION RESULTS

- in the low SNR (2) regime, LVDF clearly outperforms the "gold standard"
- for the medium and high SNR regimes, LVDF exhibits a competitive performance (HEM(Z) essentially the same as the "gold standard")
- for the ODF based algorithms, the EM version significantly outperforms ML(Y)
- for larger values of SNR the accuracy of all the algorithms improves
- the ML(E) algorithm, together with both variants of the LVDF algorithms approx. achieve the nominal level of 95% for all SNRs examined, whereas the ODF ones fall short
- LVDF proves to be robust to signal model and to the noise distribution misspecification

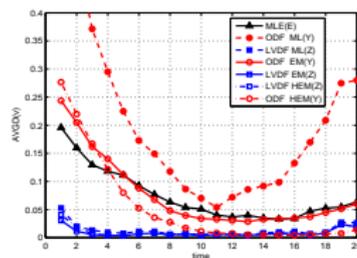

- Examine the performance of the various algorithms when it comes to tracking the position of a target moving through the monitoring region
- Assume sensors record energy readings at time slots  $t = 1, 2, \dots$  and make decisions at each time slot
- Combine the results for target location and signal magnitude over time using an exponentially weighted moving average scheme (EWMA):

$$v_t = \lambda \hat{v}_t + (1 - \lambda)v_{t-1}, \quad t = 1, 2, \dots$$

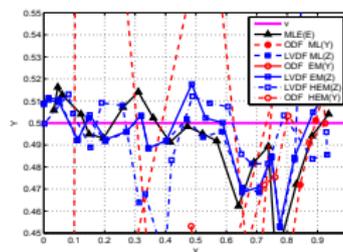

$$S_{0,t} = \lambda \hat{S}_{0,t} + (1 - \lambda)S_{0,(t-1)}, \quad t = 1, 2, \dots$$

- use  $\tilde{v}_{t-1}$  as a starting value for localization at time  $t$

- Scenario: Target moving from west to east through the middle of the monitoring region; signal is stationary  $S_{0,t} = 2$  with SNR=2

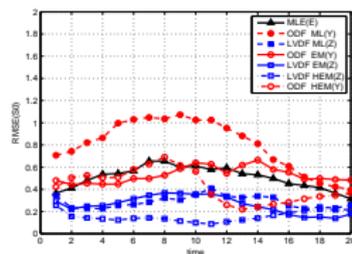

Scenario 1:AVGD

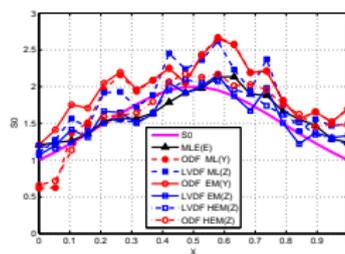

Scenario 1:Trajectory

- Scenario 2: Target is stationary at  $v = (0.25, 0.25)$ ; the signal amplitude evolves over time,  $S_0(t) = 2/(1 + 0.01(t - 10)^2)$ .

Scenario 2:RMSE

Scenario 2:Diagnostics

# MULTIPLE TARGETS: PROBLEM FORMULATION

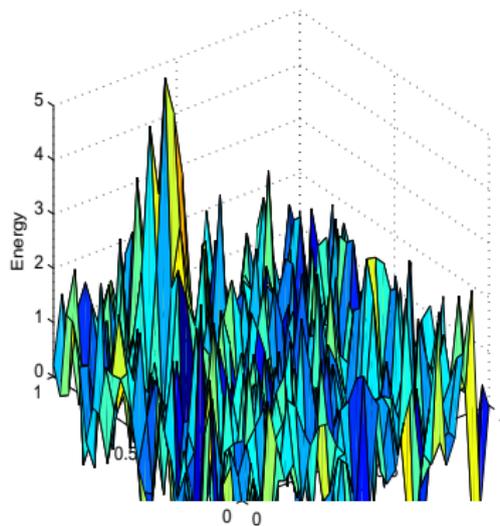

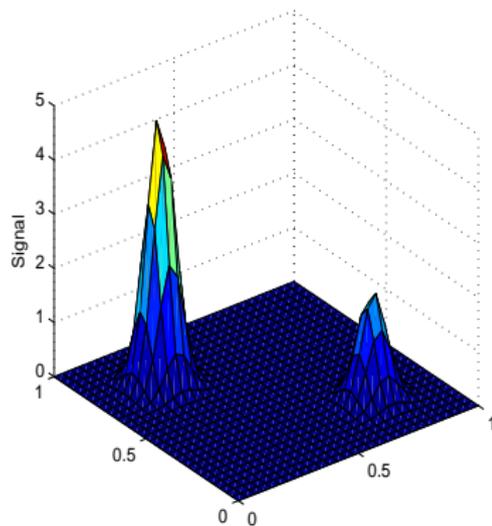

There are  $p$  possible targets in the monitored region, and each target at location  $v_j \in R$  emits a signal  $S_i^j \equiv S_i(v_j)$  measured at sensor location  $s_i$ . The energy measured by the  $i$ -th sensor is:

$$E_i = S_i + \epsilon_i = \sum_{j=1}^p S_i(v_j) + \epsilon_i,$$

where  $S_i(v_j) = S_0^j C_{\eta_j}(\|s_i - v_j\|, \eta_j)$  is the signal model for the target  $j$ ,  $j = 1, \dots, p$ .

- The detection techniques are extended to the **multiple target detection** problem.
- The **multiple target localization** is more challenging, when the number of targets present is unknown.

# THE TWO-TARGET SIGNAL AND MEASURED ENERGIES GENERATED BY MODEL M1

$S_0^{(1)} = 5$ ,  $v_1 = (0.25, 0.75)$ ,  $S_0^{(2)} = 2$ ,  $v_2 = (0.75, 0.25)$ ,  
 $\eta_1 = \eta_2 = 0.07$ ; the noise with  $\sigma = 1$ .

# HEURISTIC ALGORITHM FOR MULTIPLE TARGET LOCALIZATION

- 1 Obtain initial (ODF) or corrected (LVDF) decisions.
- 2 Apply a clustering technique to the locations of positive decisions. The number of targets may be assumed known or the clustering technique can be used to estimate the number of targets.
- 3 Apply any of the localization and signal estimation techniques described before to each of the clusters separately to obtain location and signal amplitude estimates for each target.

LOCALIZATION  
AND TRACKING

PERFORMANCE  
EVALUATION

MOVING TARGETS

LVDF (top row) and ODF (bottom row)

The LVDF algorithms prove to be:

- highly accurate in terms of location estimation
- robust to the presence of high levels of noise
- robust to signal model and noise distribution misspecifications

De-noising LVDF property helps:

- estimating number of multiple targets and their location
- scheduling sensor sampling regime
